The main advantage of fabrics as reinforcements in cement-based composites is the enhancement of mechanical behavior, especially when low modulus low-cost yarns are used. In addition, modern textile technology offers a wide variety of fabrics with great flexibility in fabric design and control of yarn geometry and orientation.

For Portland cement based concrete and other composites the reaching of thermal load of 400°C is significant, when important product of hydration, Ca (OH) 2 -portlandite, decomposes to quick lime and CO 2. Origin of lime during temperature loading or some fire accident could be source of secondary internal stresses because of lime hydration.

Engineered cementitious composite (ECC) is a cement-based material consisting of cement, fly ash (FA), sand, water, a chemical admixture and short discrete fibers [1]. ECC is known for its enhanced tensile ductility, with the tension strain ranging from 3% to 8% and the width of multi-cracks usually being less than 200 μm [2, 3, 4].
