Lameness is the most common cause of loss of use in horses. It can be caused by trauma, congenital or acquired disorders, infection, metabolic disorders, or nervous and circulatory system disease.

Lameness is not a disease per se but a clinical sign.

Lameness - Animal Health and Welfare Knowledge Hub

The most common presenting complaint is that horses would not reverse direction to stay on individual cattle during cutting. Lameness was more common in hind limbs (67%) compared with forelimbs (33%) with the stifle being the most common site for lameness affecting 25% of horses.

dogs experience.

Clinical signs include limping, bleeding, and sometimes excessive licking at the paw.

Treatment depends on location and severity of the cut. Cuts on the feet may take longer to heal than other parts because it is a weight bearing surface.
