Experimental Virology. Viruses are vehicles which transmit biological information, reprogramming the function of human, animal or plant cells to produce progeny virions. Viral pathogens are very small, often with a very simple structure. Indeed, enveloped viruses are composed only of a protein shell filled with genetic material, surrounded by a lipid envelope decorated with viral proteins.

It has been 10 years since the publication of the fourth edition, during which there has been an explosion of conceptual and factual advances. The fifth edition of Plant Virology updates and revises many details of the previous edition while retaining the important earlier results that constitute the field's conceptual foundation. Revamped art, along with fully updated references and increased focus on molecular biology, transgenic resistance, aphid transmission, and new, cutting-edge topics ...

Virology is the study of viruses – submicroscopic, parasitic particles of genetic material contained in a protein coat – and virus-like agents. It focuses on the following aspects of viruses: their structure, classification and evolution, their ways to infect and exploit host cells for reproduction, their interaction with host organism physiology and immunity, the diseases they cause, the ...

Virology - Wikipedia

In the following decade many diseases of plants were shown to be caused by viruses that were carried by insects and in 1939, Francis Holmes, a pioneer in plant virology, described 129 viruses that caused disease of plants. Modern, intensive agriculture provides a rich environment for many plant viruses.
